The model of the atom made by Neil Bohr depicts a positively charged nucleus surrounded by a negatively charged ring of electrons that move in circular orbits. It was a large advancement in the field because Bohr's model described, for the first time, that an electron must absorb energy to move between orbits.

attract them toward the nucleus—this is Bohr's "solar system model" of the atom. 32 Information: Light Recall that light is a wave. White light is composed of all the colors of light in the rainbow. All light travels at the same speed (c), 3.00×10^8 m/s. (The speed of all light in a vacuum is equal to c .)

Unfortunately, despite Bohr's remarkable achievement in deriving a theoretical expression for the Rydberg constant, he was unable to extend his theory to the next simplest atom, He, which only has two electrons. Bohr's model was severely flawed, since it was still based on the classical notion of precise orbits, a concept that was ...

Bohr uses Rydberg's formula for explaining how the electrons emit light as they move from one orbital to another. The point Bohr was trying to get across is that energy is not continuous in an atom. We can say that an atom that is in the lowest energy level is in the ground state, and if it moves to a higher level it is in an excited state.

The final area of trouble is in creating the Bohr model of the neutral atom. When this is done incorrectly, students can not ascertain the effect of ionization changes to become an ion. For next year, I plan on altering this activity. I would provide the Bohr model and particle information for the neutral atoms.
